

# Vendor Onboarding Portal

**Stack:** React + TypeScript (Frontend) · Python + FastAPI (Backend) **Time:** 30 minutes

**Tools Allowed:** Cursor IDE, any AI assistance

## Context

You are building a mini Vendor Management System for an HR/hiring team. The team needs a simple internal tool to register new vendors (staffing agencies, freelance platforms, consultants) and view a list of all registered vendors.

## Core Requirements

### Backend – FastAPI

**POST /vendors** — Register a new vendor with the following fields:

- name (string, required)
- category — one of: Staffing Agency, Freelance Platform, Consultant
- contact\_email (string, required)
- status (default: Pending Approval)

**GET /vendors** — Return the list of all registered vendors.

Store data in-memory. No database needed.

### Frontend – React + TypeScript

- A form to register a new vendor (name, category, email)
- A table that displays all vendors along with their status
- The list should update after a new vendor is added

## Bonus Tasks (if time allows)

- Filter vendors by category
- Add an Approve button per vendor that changes their status to Approved
- Basic form validation (valid email format, no empty fields)
- A clean, usable UI

## Deliverables

- A running backend on localhost:8000
- A running frontend on localhost:5173 (or any port)
- Both should communicate — a form submission should reflect in the vendor list

## Suggested Time Split

| Phase                              | Time       |
|------------------------------------|------------|
| Setup and scaffolding              | 5 minutes  |
| Backend (routes + in-memory store) | 8 minutes  |
| Frontend (form + list)             | 12 minutes |
| Wiring and end-to-end testing      | 5 minutes  |

## Getting Started Tips

- Scaffold your FastAPI app first — you can test it quickly via Swagger at /docs
- Use Vite to bootstrap React: `npm create vite@latest`
- Enable CORS in FastAPI or your frontend API calls will fail
- No auth, no database, no deployment needed — keep it simple
